

VRTS3 Distributed System Demo Board

Description

The VRTS3 demonstration board is a self-contained board designed to support a wide range of typical distributed system measurements. Input power is provided via a USB port using a typical USB-A to USB-B cable. No additional equipment is required for this board other than the measurement instruments.

Demonstration circuits

The board contains eight individual circuit sections as identified in Table 1. These circuits are typical in most distributed systems providing an excellent test bed for demonstrating non-invasive, in-system measurement, optimization, and troubleshooting techniques.

Table 1 Circuit Sections on the VRTS3 Board

SECTION	FUNCTION
POL	5V USB input to 3.3V 2.8MHz switching regulator
REF03	2.5V low noise voltage reference
OPAMP	245MHz Bandwidth unity gain opamp buffer
LDO	LD1086 voltage regulator 5V USB input to 3.3V output
CLOCKS/BUFFERS	10MHz and 125MHz clocks
CALIBRATION	Short-Open-Load and 1 Ohm calibration ports
PLANES & CAPS	Parallel tantalum and ceramic capacitor on a small PCB plane
MICROSTRIPS	50Ω microstrips with precision aberrations - one with a ground void

The USB connection provides +5V voltage for the POL, REF03, and LDO. The output of the LDO or POL provides power to the 10MHz and 125 MHz clocks, depending on the position of the SEL1 switch.

The REF03 voltage reference provides a 2.5V output voltage to the non-inverting input of the unity gain opamp. The REF03 output can be loaded with two different capacitors (C102 and C103) using the S101 switch. The capacitors are used to demonstrate the effects that output capacitance has on the stability of the REF03.

The CLC1007 opamp input is the 2.5V output voltage of the REF03. The opamp operates at unity gain. The opamp is powered as a single rail using the +5V input as the positive supply voltage.

The CAL section of the VRTS3 port provides convenient OPEN, SHORT, and LOAD calibrators for use with a 1-port probe. The calibration is important to ensure accurate measurements on VNAs. A 1 Ohm calibrator resistor is also provided for use with a 2-port probe.

The LMR10515Y POL regulator is powered by the +5V USB input voltage. The feedback loop can be opened and closed using the top switch of S1. The bottom switch of S1 can be used to change the output voltage between 2.5V and 3.3V. There are three output resistors (R5, R6, R7) that can be added

to the output using the S2 switch to increase the output current. An input damping resistor (R2) can be added at the input using the S2 switch. The POL is able to power the clocks and buffers if the SEL1 switch is in the left position.

The LDO section includes an LT1086 that is powered by the post-filter 5V input and outputs 3.3V. The S301 switches control which output capacitors (C301, C302, C303, and C410) are present at the load. The LDO is able to power the clocks and buffers if the SEL2 switch is in the right position.

The planes and caps section contains a 470uF tantalum capacitor (C601) in parallel with a 0.1uF ceramic capacitor (C602).

The Clocks and Buffers section contains one 125MHz clock and two 10MHz clocks, along with buffers for each clock. The 125MHz clock output is connected to one NC7SZ04 inverter (U401). The 10MHz clock output is connected to two NC7SZ04 inverters (U402, U403) in parallel. A 15uF damping capacitor (C410) can be connected to U401 by using the S402 switch. The EMI probe can be used to observe the various frequencies of the clocks.

Supported Measurements

TEST	SIGNAL INJECTORS NEEDED
1 Port Impedance	DC Block
Output Impedance	See Impedance Table 2
Bode Plot	J2100A or J2101A
Non-invasive Stability	See Impedance Table 2
Switching Frequency	
Switch Rise Time	
Duty Cycle Jitter	
Noise	DC Block , 1 Port Probe , Preamp
PSRR	DC Block , J2120A , or J2111A
Step Load Response	J2111A or J2112A
Clock Jitter	
Clock Rise Time	
Jitter Sensitivity	DC Block
Power Supply Impedance	See Impedance Table 2
Crosstalk	
Clock Buffer PDN Noise	DC Block
Clock Buffer Impedance	See Impedance Table 2
Parallel Capacitor resonance	1 Port Probe
Plane Impedance	1 Port Probe
Velocity Factor and Er	
Trace Impedance	
Impedance of Broken Ground	
2 port Shunt Thru Impedance	J2120A , 2 Port Probe , DC Block
Ripple	DC Block , Preamp
EMI	Near Field Probes

Table 2 Picotest Product Applicability Impedance Matrix

Measurement	PDN Probes	Current Injector	Pre-amplifier	DC Blocker	Current Probe	Common Mode Transformer	Impedance Fixture
1-port reflection 0.5Ω-2.5kΩ	X						
2-port shunt thru 25uΩ-25Ω	X		X			X	
2-port series thru 25Ω-1MΩ	X						
3-port voltage/current 1mΩ-2kΩ	X	X	X		X	X	
Impedance adapters 0.1 Ω-400kΩ							X
1-port TDR 10mΩ-1kΩ	X			X			
2-port TDT 10mΩ-1kΩ	X			X		X	
Transient extraction mΩ-1kΩ	X	X	X	X		X	

Switches are used to allow various configuration settings for many of the circuits. A summary of the switches is included in Table 2.

Table 3 Switch Functions

POSITION	ON	OFF
S1		
1	4.99Ω Bode plot injection resistor	Open feedback for use with the J2110A Solid State Injector
2	Sets POL output to 2.5V	Sets POL Output to 3.3V
S2		
1	0.51Ω filter damping resistor	5.41Ω filter damping resistor
2	DISABLE POL regulator	ENABLE POL regulator
3	Add additional 100mA load to POL	
4	Add additional 100mA load to POL	
5	Add additional 100mA load to POL	
S101		
1	0.1uF ceramic capacitor	
2	0.33uF ceramic capacitor	
S201		
1	5.1pF NPO capacitor	
2	10pF NPO capacitor	
S301		
1	22uF ceramic capacitor	
2	100uF 30mOhm ESR tantalum capacitor	
3	2.2uF 0.5 Ohm ESR tantalum capacitor	
4	15uF 0.4 Ohm ESR tantalum capacitor	
S401		
1	DISABLE 125MHZ clock	ENABLE 125MHZ clock
2	DISABLE 10MHz clock	ENABLE 10MHz clock
S402		
1	15uF tantalum damping capacitor U401	
SEL1		
	LEFT	RIGHT
	125MHz clock POL powered	125MHz clock LDO powered
	125MHz clock unpowered	

The demo board is shown pictorially in Figure 1.

Figure 1 Demonstration Board.

Powering the Board

Step 1: Make sure Switch S1 is set to the 'ON' position.

Step 2: Plug one end of the USB cable into the USB port on the VRTS board. Plug the other end of the USB cable into any USB power supply or computer USB port.

Safety Information

Caution: To avoid equipment damage and/or severe injuries or death ensure that the absolute maximum ratings defined in this manual are observed at all times.

Characteristic	Rating
Absolute Maximum Input Voltage	5.25V
Maximum Output Voltage	+/-5V
Maximum Input Current	500mA
Temperature range	0-50°C
Absolute Maximum Voltage	<50 VAC and 75VDC
